

Evidence Pool Atlas

Distinct roles, lengths, and PI/HN/UC prevalence across four frozen evidence pools.

POOL AND SAMPLING ROLE	SIZE			CONSTRUCT PREVALENCE	
Natural500 natural control Estimate construct behavior in a less enriched SWE-agent pool.	500	8,550	17.1	PI	98.4%
	Traj.	Steps	Avg.	HN	33.0%
				UC	26.8%
Enriched500 enriched difficult Study difficult loop-heavy cases and HN/UC boundary behavior.	500	26,014	52.0	PI	99.8%
	Traj.	Steps	Avg.	HN	77.4%
				UC	58.2%
StressFresh100 stress challenge Stress-test intervention risk and UC/HN boundary cases.	100	3,132	31.3	PI	92.0%
	Traj.	Steps	Avg.	HN	46.0%
				UC	82.0%
OpenHands External330 external horizon Probe external long-horizon generalization and length effects.	330	51,010	154.576	PI	99.7%
	Traj.	Steps	Avg.	HN	15.2%
		154.576 steps, UC 1.2%		UC	1.2%

Design implication: pool separation is part of construct validity; roles, lengths, and PI/HN/UC prevalence differ sharply.
